

DE GUZMAN, MARY RECHELLE

BSIS202

The program starts with the “main” method, which is the passage point for any Java application.

Two ArrayLists are made: "intergerList" and "stringList". The integerList will store the number of items, and the stringList will store String objects.

The "integerList" is populated with three numbers: 50, 100, and 150 using the "add" method.

A message is printed to the console, and afterward, every component in the "integerList" is printed out using a for each loop.

The same process is repeated for the “stringList”, but this time with the strings "Hi", "World", and "Java".
